Anonymous submission to EASRP 2026

Formatting: up to 8 pages of main text at 11pt on A4; references and any appendix do not count toward the limit. Keep the submission anonymous (no names, affiliations, or identifying acknowledgements).

Abstract

Write a short abstract here, roughly 150–250 words: the problem, your approach, and your main result, in plain language. Do not include anything that identifies you or your institution.

1 Introduction

Introduce the problem and why it matters, and state your contribution clearly. Write in an anonymous style: refer to your own prior work in the third person (for example, “Smith (2024) showed...”) rather than “our previous work”.

2 Related work

Situate your work among existing research: summarise what has been done, identify what remains open, and make clear how your contribution differs. Cite credible, verifiable sources, and prefer peer-reviewed papers where they exist. Preprints, technical reports, datasets, theses, and software may be cited when they are the appropriate source (as is common in machine learning); avoid relying on non-authoritative web content such as blog posts.

The accompanying bibliography file includes examples of several reference types: a journal article ?, a conference paper ?, a book ?, a book chapter ?, a technical report ?, a thesis ?, a preprint ?, and a web resource ?.

This template uses `natbib`, which offers several citation commands. Use `\citet` for a textual citation that reads as part of the sentence: ? introduced the Transformer. Use `\citep` for a parenthetical citation: the Transformer dispenses with recurrence [?]. The starred forms `\citet*` and `\citep*` list every author rather than abbreviating with “et al.”: [?]. You can also cite just the year with `\citeyear` ?, just the authors with `\citeauthor` ?, or give multiple references at once [??].

3 Method

Describe your approach, model, or argument with enough detail that an expert could follow and, where applicable, reproduce it.

4 Results

Present your findings. A rigorous negative result is valued: you will not be penalised for failing to beat the state of the art.

5 Discussion

Interpret your results, state limitations honestly, and suggest future directions.

6 Conclusion

Summarise your contribution in a few sentences.
